Much More Than the “Baby Blues”
The highs and lows often experienced during pregnancy and/or after giving birth, commonly referred to as the “baby blues” (which include mood swings, anxiety, irritability, crying, sleep problems, and sadness) are usually mild and pass quickly. But sometimes those feelings can develop into something more serious. Postpartum Depression is much more intense and lasts much longer.

Postpartum Depression can happen to anyone, regardless of:

- Work Status
- Marital Status
- Number of Children
- Mental Health History.

It can happen during pregnancy, directly following birth, or even months later. As many as 80% of new mothers experience a range of highs and lows during pregnancy and/or following birth. About 20% of new mothers experience a clinical depression; left untreated, postpartum disorders can last for several months, or even years. Both men and women can experience postpartum depression. When one parent is suffering, certainly, the rest of the family suffers.

Could You Have Postpartum Depression?
Consider the following symptoms as guidelines (if experienced every day, several times a day, reach out)

- Sad/Weepy
- Isolated/Lonely
- Guilt/Shame/Anger/
- Resentful/Anxious/Tense/
- Exhausted

Symptoms Requiring Immediate Attention:
- Loss of control
- Thoughts of hurting yourself
- Thoughts of hurting your baby
- Scary fantasies
- Visual or Auditory hallucinations

Whenever you feel it is continuously difficult to cope with daily tasks and decisions, don’t hesitate to ask for some help.

A New Baby Changes Your Life in Every Way

Becoming a parent is a major change that affects every aspect of life. It is normal to feel overwhelmed, uncertain, and sensitive as you learn about motherhood, especially in the first few weeks. However, if the troubles with adjusting to your new role persist, getting information and help as soon as possible will make a big difference in your ability to cope.
